

Independent eyecare in Crewe since 1990

Autumn/Winter

Now you can hear as well as see at Sherratt's...

We bring you the most sophisticated technology in a range of hearing solutions with price options to fit your budget.

Here at Sherratt's, you'll have access to the latest cutting-edge hearing technology from Amplifon. You'll be able to speak to our expert Audiologist, whose knowledge, care and dedication will transform the way you hear the world around you.

Sherratt's partnership with Amplifon will deliver the highest quality of service and care, in order to achieve the best hearing experience for you.

On the day of your appointment, your Audiologist will complete a comprehensive hearing test. They will then discuss your results in detail and demonstrate the best hearing aids for your needs.

To take the first steps to better hearing, simply book an appointment on 01270 505504 for a FREE hearing test where you'll have the opportunity to take a pair of hearing aids home as part of our free trial service.

Hearing aid types

In the ear (ITE)

Comfortable and discreet.

In the ear (ITE) hearing aids have the latest digital technology in a custom moulded casing that fits in the ear. Although this type can be visible within the ear, ITE hearing aids have easy access controls.

Receiver in the ear canal (RIC)

Sleeker and slimmer.

This open-fit hearing aid that uses a small tube that extends from the main part of the hearing aid which sits behind the ear. This device can produce great sound quality using less energy.

Behind the ear (BTE) Perfect fit.

From classic retro-auricles to open fitting, our hearing aids are available in a wide range of colours. Open fit hearing aids are characterised by being innovative, light and comfortable, directing the sound into the ear canal, leaving the ear open.

Q

What is an OCT scan and should I have one at my eye examination?

A

OCT stands for Optical Coherence Tomography and is a process that uses light waves to take cross-section pictures of your retina.

These pictures allow the monitoring of changes to the retina over time and can help detect eye conditions such as Macula Degeneration and Glaucoma.
